Hello Ratah

Sorry. I run your sample (thank you, it is simple and complete) but I do not get any lost EXCEL.EXE process.

I use Windows XP SP3 and Office 2003.

A detail not related with your problem: In your sample you open sheet var first with "Open" and then with "Microsoft". As you open both with the same var the second plugin kills the first so

sheet.Init("Open");

can be deleted.
