In function, `Subwindow1::OpenSubwindow()` I great a second window, known as `dlg2`, using

```
WithTheSubWindow<TopWindow> dlg2;  
CtrlLayoutOK(dlg2, "This is the subwindow");
```

Which opens fine. And I can access that window as `dlg2` only in this function. How do I access things in that window in another function else where. Like I have a button that gets the size of the window. It calls another functions, but when I type in `dlg2`. I get nothing. I have tried all kinds of things, but nothing seems to get me to that window so I can change things on it like labels or get information from it.

How can I access this window from another function.

I have attached the complete code if that helps.

david
