Hello, Luigi!

In my computer the "freezing" is indistinguishable.

However, between hw.PopUp() and Ctrl::EventLoop() lines is no animation.

Changing the order of lines should attenuate this undesirable effect.

Using a static image is more safe (although this is less spectacular).

```
GUI_APP_MAIN
{
    TopWindow app;
    HelloWorld hw;
    //hw.Title("Hello world example");//not necessary
    hw.Text(Nvl(Join(CommandLine(), " "), "Hello world !"));
    hw.PopUp(NULL,false,false,true,true);
    //Ctrl::ProcessEvent();//not necessary
    Ctrl::EventLoop();//to run animation

    app.Run();
}
```
