Hello, Luigi!

In my computer the "freezing" is indistinguishable.

However, between `hw.PopUp()` and `Ctrl::EventLoop()` lines is no animation.

Changing the order of lines should attenuate this undesirable effect.

Using a static image is more safe (although this is less spectacular).

```
GUI_APP_MAIN
```

```
{  
    TopWindow app;  
    HelloWorld hw;  
    //hw.Title("Hello world example");//not necessary  
    hw.Text(Nvl(Join(CommandLine(), " "), "Hello world !"));  
    hw.PopUp(NULL,false,false,true,true);  
    //Ctrl::ProcessEvent();//not necessary  
    Ctrl::EventLoop();//to run animation
```

```
    app.Run();
```

```
}
```
