Great news!

I tested the executable in Wine, and it works like a charm. Just the cursor looks a bit weird, should it really have that yellowish tip?

Next steps now should be

- macosx
- android
- maybe "gtk backend" - one which is more tightly bound to gtk
- ditto for QT

Volunteers needed
You forgot to add the Wayland display server to your list The drawing part will be probably quite similar to framebuffer, so it shouldn't be very difficult.

I already tried to compile wayland and get it running on my Arch Linux with mixed results - the server runs, the clients don't But as soon as I get it to work, I promise to volunteer

Best regards,
Honza
