Tried to test framebuffer on linux (Ubuntu 11.04) and get the following error:

Quote:Error reading fixed information.

in the /LinuxFB/Win.cpp (254) code:

```
if (ioctl(fbfd, FBIOGET_VSCREENINFO, &vinfo)) {  
    fprintf(stderr, "Error reading variable information.\n");  
    exit(-3);  
}
```

Tried to run the compiled example with sudo command and everithink work fine.

Any hint are welcome!
