Thanks.

Dependency walker does not see any functions in the DLL so am thinking there is something that my colleague has neglected to do that is akin to publishing the functions. I have never used DLLs before so am not really sure what am talking about. He is on vacation just now so I will have to ask him when he gets back.

Cheers,

Nick

EDIT: so I just tried linking into the DLL with MS VC++ express and a piece of code from <http://support.microsoft.com/kb/953836>

With some small adjustment I can trigger the function `turbineSpeedCalc::testFunc1`. The main difference appears to be that `Functions4U` allows me to access only global functions within the DLL whereas I appear to need access to a class. If I can make an instance of the class that is within the DLL then I should be able to access its functions.
