Subject: SqlArray and updating new database data
Posted by forlano on Sun, 28 Aug 2011 21:44:24 GMT

Hello,

my application is initially tied to a database. I have two sqlarray (master and detail) and in both the data are shown properly.
Then I close the database and open a new one with the same schema but just different data.
When I ask for master.Query() the app crash. Refesh() do noting and Update() crash as well.
Is there a way to inform the two sqlarraies that the data are changed and they need to update?

Thanks,
Luigi
