HeaderCtrl tabs do not have Display (yet?).

But it should be possible to achieve what you want using the SetImage... Not very elegant, but possible

Mirek

Any solution, even the weirdest, would be in this moment the most elegant.
That could be called SqlColumn ctrl useful to keep easily together the many variable stored in one row table.

I was thinking at these steps to modify the look of ArrayCtrl:

- 1) hide Header;
 - 2) realize a two columns array with a row for each field of the one row table;
 - 3) in the left column set via SetCtrl a button not clickable just to use its label and give us the look of the left header;
 - 4) in each row of the right column set a proper ctrl.
 - 5) collect all the values of the right column and send to the table.
- Perhaps GridCtrl could be more useful with regard the left column that I should get for free.

I'll try to perform some test.
Are there better solution to use the built in capability of SqlArray?

Luigi
