Hi Mirek,

I tested on Xfce 4.8.2, U++ revision 3869, compiled with GCC and Clang in Debug mode. It works as expected for me. The freezed application is correctly terminated by KILL signal after clicking on yes in the "do you want to kill the unresponsive window" dialog... The error might be in the desktop environment/window manager you use, not in U++

Best regards,  
Honza
