dolik.rce wrote on Sat, 17 September 2011 14:07Hi Mirek,

I tested on Xfce 4.8.2, U++ revision 3869, compiled with GCC and Clang in Debug mode. It works as expected for me. The freezed application is correctly terminated by KILL signal after clicking on yes in the "do you want to kill the unresponding window" dialog... The error might be in the desktop environment/window manager you use, not in U++

Best regards,  
Honza

Well, I am using debian 5 with gnome...

Mirek
