Hello,

GetCurrentDirectory() under linux is obtained via
getcwd(h, 1024)

Unfortunately this function return a different directory depending whether the program is run typing in console or by a double click.

This make a BIG difference if the app run another executable that depends by the "real" current directory, i.e. where the exe file resides.

I wonder if there is a safer and better way under linux to achieve the wanted purpose.

Luigi
