dolik.rce wrote on Tue, 20 September 2011 23:54: GetCurrentDirectory() returns, as the name says, the current directory, which on most non-windows systems is the directory from where the binary was executed, not where it resides. To obtain the position of the binary, there is GetExeFilePath().

Best regards,  
Honza

PS: Also, the current directory can change while the program is running.

Ops... Thank you for this precious info!  
It means GetExeFilePath() is what I need for both OS when the position of the executable is important to reach other files.

The change of current directory may happen even under windows?

Luigi
