tccler wrote on Sat, 24 September 2011 15:01ok, next question. how to create custom sorting function for column in arrayctrl?

```
int cmpv(const Value& row1, const Value& row2)
{
    if (pureValue (String(row1)) > pureValue (String(row2))) return 0; else return 1;
}
```

function works fine, but sorting the table does not:

```
ExampleTable.ColumnAt(2).Sorting(cmpv);
```

access violation in Upp::sAC_ColumnSort::operator()(const Upp::Value & a, const Upp::Value & b):

```
ExampleTable.ColumnAt(2).Sorting(FnValueOrder(cmpv));
```

any ideas, please.

I am sorry, but there is too many variable not quoted in your post.

I suggest you to provide some minimal testcase (one complete enough to compile and run).
