question still relevant.

upd.: solved. sorting class from ArrayCtrl.cpp:

```
struct SAC_ColumnSort : public ValueOrder {
    bool      descending;
    const ValueOrder *order;
    int       (*cmp)(const Value& a, const Value& b);
```

```
virtual bool operator()(const Value& a, const Value& b) const {
    return descending ? cmp ? (*cmp)(b, a) < 0 : (*order)(b, a)
                      : cmp ? (*cmp)(a, b) < 0 : (*order)(a, b);
}
```

};
cmp function must return a negative value if value1 > value2 and positive if value1 < value2. why not true/false??
