We now unfortunately included Watcom builder as well - how does it react to BOM?

The Open Watcom compiler has following options for this case:

- zk0 double-byte char support for Kanji
- zk0u translate Kanji double-byte characters to UNICODE
- zk1 double-byte char support for Chinese/Taiwanese
- zk2 double-byte char support for Korean
- zkl double-byte char support if current code page has lead bytes
- zku=<codepage> load UNICODE translate table for specified code page

Yes, it is not very capable to build U++ applications, after some tests, but it capable to build Open Watcom sample applications.

If you think, it is unfortunate to have such a builder, you can remove it before release. I can move it to Bazaar section on the forum.
