Well, yes, but then I could also write a small app that replaces all \xxx code with corresponding chars... but It'll be also a workaround... Anyways, I could also write a script that "repairs" .t files replacing \xxx codes with corresponding chars and back, but that one would also be a workaround.

The best would be to ask theide to do it automatically

Maybe a good idea would be to have a file with 2 choosen languages:

IT-IT <--> DE-DE
someitaliantranslation
somegermantranslation
.....

Or, maybe keep it as it is now, with english + space for dest language AND a language of choice as comment/guideline between them. That'll make translation easy also for people that can't speak english.
