

I want to display Indian languages Unicode scripts.

I was experimenting with changing the script on the fly with selection buttons.

Most of Indian language scripts are multi tier. Generally 3 some times 4.

"upp-indian-fonts.png" file shows the strings as seen in TheIDE and in Notepad++. The text was created in notepad++ and pasted in TheIDE.

Win 7 It is working fine with proper font selection. Button text displayed properly. If I choose wrong font for the button text display then button text is not displayed correctly but "Title" is always displayed correctly.

"Windows-Screen.png" shows windows 7 screens.

Same code compiled in Ubuntu 10.04 is not showing correct font rendering. But title text is rendered correctly.

"Linux-Screen.png" file shows output.

To check my font installation I pasted the code from TheIDE to emacs ( Ubuntu ). All font rendering is correct.

"Linux-emacs.png" font rendering in emacs on ubuntu.

There are two Indian scripts in the text.

Request for some hints. How to get correct rendering.

Thanks.

Deepak.
