Hello.

By means of community the package under Altlinux (altlinux.ru) has been collected.

TheIDE is running.

But when I launch compilation, there is a message:

Quote: fatal error: Core/Core.h: There is no such file or the directory
compilation terminated.

In "/usr/share/upp/uppsrc/Core" I'm show this files.

And in application directory there are empty directories with a title of used libraries: CtrlLib, Core, Draw, etc.

How much I have understood, business in ways to files. Only where to look and where to adjust it, I can't find.
