The package looks good, as far as I can say from non-rpm distribution... So the problem is probably in the way theide sets things up upon the first start. Could you try to delete/rename .upp directory in your home and start theide? You should be presented with a wizard dialogue to set up the code locations. Please leave everything on defaults and click finish, it should produce a working settings.

If it still doesn't work after this, please send me the files uppsrc.var, MyApps.var and updates.xml that got created in the .upp/theide directory inside your home directory.
