Lance wrote on Thu, 01 December 2011 21:59Impressive.

Depending on how likely 0 length memory is "copied", it may be desirable to add a branch to handle it.

```
case 1: t__[0] = s__[0]; \  
    case 0: \  
    break; \  

```

Tom's code takes care of 0 length string without memcpy, just as above.

Yes. Thanks.

Mirek
