Hi,

+1 !

I totally agree with ricper : he says exactly what I feel with upp. Very good ! And easy to use (it's obvious, as he says)... when you know how to do !

The problem is that :

- Not enough documentation
- Some very good documentation, clear and nice to read, but very difficult to find,
- Things strangely done, like PromptOk example...

All that is discouraging for people trying UPP. If someone doesn't have a strong will to learn it, if someone just "try to see", he will be discouraged.

In the contrary, if attention is given to do better about doc and usefull names for function/classes, someone trying UPP will like and adopt it, as it has really a lot of advantages compared to other products !
