Hi Nick,

The documentation to umk was updated, just after the changes. See
http://www.ultimatepp.org/appideumk$en-us.html

On windows, you have to either specify paths to all nests
umk.exe path/to/MyApps:path/to/uppsrc MyPackage ...
OR
create a .var file to the directory where umk.exe resides (you can just copy it from theide
directory).

The same holds for .bm files. You have to either specify full path, or copy the file to the same
directory as umk.exe. This is because on windows there is no reliable way to locate the files. (On
POSIX systems it is simpler, as we can look to the standard ~/.upp/umk and ~/.upp/theide
directories).

Also, there '+' is now used instead of '>' preceding to flags.

Is this sufficient explanation?

Best regards,
Honza
