I asked my how to make use of more than one .sch file, I mean if I want to use more than 1 sqlite3
database and want to use schema files?

For one it is clear, first I tell which file I want to use
#define SCHEMADIALECT <plugin/sqlite3/Sqlite3Schema.h>
#define MODEL <urlaub/urlaub.sch>
and then
SqlSchema sch(SQLITE3);
 All_Tables(sch);
 SqlPerformScript(sch.Upgrade());
 SqlPerformScript(sch.Attributes());
but I can't see how to specify more than one file for more than one database!
