Wolfgang wrote on Tue, 13 December 2011 13:15hmm I dont know how to compile the uppweb package... is it possible on a windows machine?

Yes it is possible. But you have to have the sources - you can check them out from the public mirror, if you don't already have them:svn.exe checkout

<http://upp-mirror.googlecode.com/svn/trunk/> upp-mirror

Now you have everything necessary and you just have to tell theide where to look. To do this create a new assembly which will point to following

nests:C:\somepath\upp-mirror\uppbox;C:\somepath\upp-mirror\rainbow;C:\somepath\upp-mirror/uppsrc If you're not sure how to create new assembly, have a look here (the pictures are quit outdated but the general information is still valid).

Now you can open uppweb package in this assembly, compile it and run it. It will generate the pages somewhere on your disk (not sure about the default now) and generate uppweb.xml configuration file in your home directory where you can tweak the paths for future runs.
