Everything else looks like a middle age technology if you look to some Smalltalk environments (e.g. VisualWorks from Cincom) .

Having refactoring support in TheIDE would be nice, but creating this feature would take a huge amount of time. I just asked .

I don't thing that lack of this is a major trouble if you don't change your code a lot. I know a lot of people (ehm, most of my colleagues) who are writing university information systems in Perl. They are using GVim. It does't even have a decent code-completion (if any).

Thank you for replies
