
Subject: SqlMassInsert - remove option

SqlMassInsert now got a SqlBool to EndRow, useful in scenario when the operation is "replace" - replacing many rows in database.

SqlMassInsert then combines all these SqlBools and issues a single 'delete from TABLE' before inserting new rows (by combined insert .. select union commands). All commands for group flush are combined into transaction and there is also a new IsError flag.

Example:

SqlMassInsert ins;

```
...
for(...) {
    ins
    (DAY, day)
    (KEYWORD, keyword)
    (SERVICE, service)
    .EndRow(DAY == day && KEYWORD == keyword && SERVICE == service);
    if(ins.IsError())
        throw "SQL error!";
}
```
