Subject: SqlMassInsert - remove option
Posted by mirek on Fri, 20 Jan 2012 10:45:14 GMT

SqlMassInsert now got a SqlBool to EndRow, useful in scenario when the operation is "replace" - replacing many rows in database.

SqlMassInsert then combines all these SqlBools and issues a single 'delete from TABLE' before inserting new rows (by combined insert .. select union commands). All commands for group flush are combined into transaction and there is also a new IsError flag.

Example:

```
SqlMassInsert ins;
...
for(...) {
 ins
  (DAY, day)
  (KEYWORD, keyword)
  (SERVICE, service)
  .EndRow(DAY == day && KEYWORD == keyword && SERVICE == service);
 if(ins.IsError())
  throw "SQL error!";
}
```
