Would it be possible for this message to print the total occupied RAM by the application before the call to new and the size of the requested block that caused the crash.

I can try... I cannot guarantee this is possible.

Thank you! It needs to be pure informative. If I have 400 MiBs used and I allocate 10 more and it runs out of memory there is probably some other cause, maybe something with the DLL. If I allocate another 200 and I did not mean too then clearly my code is all wrong.

Most of the times when this panic message triggers I am sitting at around 300 MiBs.
