Subject: Sql column Ids now escaped

SqlId column names are now escaped when inserted to SqlExp and when they actually do contain valid sql IDs (or valid of/as combinations). This is to support things like

Select(SqlId("FROM")).From(TABLE)

...

Note that this changes a way how Sqlld::Of and Sqlld::As are represented inside Sqlld (some special <32 character is inserted instead of '.' for Of, for As there were special characters before, just other). Other than that, Sqlld::ToString still returns unescaped id and should be backwards compatible.

MySql is by default using '`' instead of " to do escapes, this is supported.

If Sqlld does not contain valid sql id, it is not escaped. This is done to support things like:

Select(SqlId("\*")).From(TABLE)

which seems to be used in existing code.

In related news, I have changed SqlAll() to return SqlId instead of SqlVal, which makes possible

Select(SqlAll().Of(TABLE)).From(TABLE)

which translates to

select TABLE.\* from TABLE
