No problem at all.

I know that stored procedures are being executed in the same form. If I do this:

```
SQL.Execute (  
    "{call stored_procedure_x (?, ?, ?)}",  
    item.A,  
    item.B,  
    item.C  
);
```

The stored procedure IS being executed and runs, but item.C is an output parameter and isn't being populated, obviously. Performing a SQL.Fetch() doesn't show any returned rows either.

It appears there is some other medium by which this output parameter is assigned. Other places suggest an RPC mechanism whereas in the past MSSQL relied on returning a result set.

Irritating.
