I am a beginner myself, so perhaps not the most indicated person to answer, but here are my two cents. Unless there is something really advanced that you have to do with VC++, I don't really see any need to change back and forth between the two IDEs. U++ can produce executables using the VC++ compiler, and you can also link libraries directly.

The VC++ debugger is of course a plus, but on the other hand since you want to port the code to linux, I honestly don't see why you should bother with the whole cumbersome experience instead of just sticking to U++ and letting it do the hard work for you.
