But, I am sorry, IMO, PLATFORM_POSIX meaning is too wide and confusing..

Why confusing? The sole purpose is to identify API for conditional compilation. POSIX represents a pretty wide but guaranteed set of API calls, which is different from Win32 API.

Surely, PLATFORM_LINUX or PLATFORM_BSD are narrower subsets, but it is definitely worth to have superset, as most things are the same.

Mirek

ok, thanks. I will try to adjust them as little as possible to be fit for purpose. And then you adjust...
