Subject: Ctrl responds to Language-Setting event?

If I change language, the main menu reflects it immediately. Not other Ctrl-derivatives. Only Ctrls created afterwards will reflect the change in language setting. Is it a way to make Ctrls responds to change in language setting? For example, it is possible to defer language-translation to Paint() so that a call to Refresh() will do?

Another problem I encountered with changing language setting is with EditDate. Due to date scan format changing, it will not Accept() the date string it previously displayed.
