I created an application on U++ on the order of one Moscow company. This is a discount kiosk 2.5 meters in height with a touchscreen, running on a processor Atom.
The biggest challenge was to make on such a processor, a continuous HD video at the top of screen and at bottom the discount coupon kiosk interface.

To view the video package has been developed called VLCplayer (see in the bazaar). In which were used Koldo ideas, but greatly improved performance by rewriting from 0 and discard all the excess.

To display map of shopping center Anton(sc0rch) made package MapRender (see in the bazaar). Print coupon checks used my generator based on the reporting forms QTF templates RepGen (see in the bazaar). In addition, developed back-office systems and automated synchronization of content-based ssh.
