I have got agg working to upp ImageBuffer. That means, I guess (I haven't tested all the examples), it is possible to use all power of agg with Ultimate++!

One interesting thing that if I use one more separate buffer (not ImageBuffer directly atached to agg::rendering_buffer) with memset and then memcpy it to ImageBuffer, animation looks significantly better (less shearing) in my eyes... Any ideas why? (I tried to slow down things with GuiSleep but that doesn't help...)

P.S. Some more thoughts...

The second thing is that if to adapt more things from upp to agg then 2/3 of agg would be possible to throw away... New Image and things are superb!

The third thing, I can't believe my eyes but it looks that it's possible to have even 1/256 pixel accuracy (at least visual) only with upp! E.g. during my experiments I've made a smooth horizontal line going from 1 pixel to 2 pixels width (256 length)...
