Hi,

I want to print a double with one decimal place like

57.2m Speed

so naturally I use

String s = Format("%.1fm Speed",height);

and this usually works. However, just now my program complains that it can't find the fm format specifier.

I went to the documentation on Format and it appears to say that I should do this

String s = Format("%1fm Speed",height);

but that really doesn't work. That gives

57.200000m Speed

For now I will have to leave a space between but really I think it should recognise the f and ignore the m.

Cheers,

Nick
