
Subject: Search for constant and show it....

Hi,

I've got an untypical task, I have a namespace with a amount of constants (const uint16 ...) and for debugging reasons I want to search for the name of the constant by their value:

For better understanding:

namespace CanMethod

```
{  
const uint16 PING_REQUEST = 1001;  
const uint16 PING_REPLAY = 1002;  
const uint16 DEVICE_STATE_REQUEST = 1003;  
const uint16 DEVICE_STATE_REPLAY = 1004;  
}
```

(the real list is larger than the examble...)

I get the value "1003" and now I want to get the String "DEVICE_STATE_REQUEST" - is this possible without to create a complete new list with all constants?
