You're talking not about that. I was talking about something else (read my previous post). I do not understand how the subject is connected with the function of `sqlite3_column_name`. Talk about that (even in SQLite) you can execute the query

```
SELECT PLANT.NAME FROM PLANT
```

and it will be correctly understood by the SQL driver.  
(By the way, - try make DUMP of `NAME.Of(PLANT)` )
