awksed wrote on Wed, 23 May 2012 15:28Hi,

Menu option Setup->Build Methods allows compiler and linker options to be set including additional libraries. These appear to be common to all projects.

How do I set compiler, linker options and additional libraries, and include paths etc. for a specific project only?

Thanks,

Jan

Hi Jan,

Go to Project -> Package organizer ... In the organizer select package you want to adjust (probably your main package) and right click in the empty area on the right and select one of New {link option, compiler option, library}. The rest should be easy For more detailed info you should read the article Getting started with TheIDE. The various settings are described in the "What is stored where ?" section.

Best regards,
Honza
