Hi Koldo:

it's in CtrlCore.h

```
public:
enum StateReason {
    FOCUS      = 10,
    ACTIVATE   = 11,
    DEACTIVATE = 12,
    SHOW       = 13,
    ENABLE      = 14,
    EDITABLE   = 15,
    OPEN       = 16,
    CLOSE      = 17,
    POSITION    = 100,
    LAYOUTPOS  = 101,
};
```

Not sure if it's because of a namespace issue. I'll do a test compilation in Ubuntu in a while.  
WithPopUp<> inherits from Ctrl or its derivative, so POSITION should be visible to it. Anyway, it  
use explicit Ctrl::POSITION or Ctrl:::StateReason::POSITION silence the compiler, please let me  
know.
