Thank you Ion

I wanted to do a program in U++ to download a file. Because of it I used GuiWebDownload as a base.

About this:

Quote:1. Content-Type: more detailed is described here

I have used this: `http.Header("Content-Type", "application/octet-stream");`

Quote:2. Content-Disposition:attachment; filename="<wanted file name for save>"

I have used this: `http.Header("Content-Disposition", "attachment; filename=<fileName>");`

Quote:3. Content-Length: <your file length>

I do not know file length before downloading it. Does it serve when uploading files?
