---

I met a strange problem linking against HexView on Linux. Linker is complaining about undefined references in all configurations. In case of BLITZ I couldn't see BLITZ-related part. In case of non-BLITZ configurations I can see linking against HexView.a, but this still results into undefined references.

I do not have such problem in Windows.

Any idea what can be wrong in this case?

Upp rev. 5046 (latest)

TIA
