Hi,

Recent versions of UPP (5110 through 5180 - maybe earlier) are highly unstable in 64bit builds. Popping up a dialogue can repeatably crash applications. This affects both my applications and of course it is not debuggable as x64 debug works fine.

However, I have an example for you. Try compiling the example UWord in MSC10 32 bit and 64 bit and you'll see that the 32 bit version runs fine and the 64 bit version crashes immediately.

I need to revert back to a much earlier version till this is fixed but hopefully it is easy to repeat.

Cheers,

Nick
