Subject: Re: Raspberry (Raspbian) - ARM 6 Core + Ultimate++?
Posted by dolik.rce on Sat, 18 Aug 2012 15:41:18 GMT

Hi Wolfgang,

Congratulation on the successful build

Points 2. and 5. should be committed to Core soon. Points 3. and 4. should be properly solved by editing include and lib path, respectively. When using tarball, just add the paths to CINC and LIBPATH variables at the beginning of uppsrc/Makefile.

I believe that compiling anything using U++ on Raspberry would be reaaally slow. Especially when using makefile (thus not using BLITZ) on single core processor. That is why cross compiling was invented

Honza
