
Subject: Allegro5 - Scope addon

There are some ALLEGRO_* types, which require resource management, such as ALLEGRO_BITMAP, ALLEGRO_DISPLAY, ALLEGRO_EVENT_QUEUE with al_destroy_bitmap, al_destroy_display, al_destroy_event_queue function respectively, etc.

For such cases I created allegro5/scope C++ addon. It consist of:

- al_destory template function, which invokes appropriate al_destroy_* function, based on argument type:

```
Toggle example#include <allegro5/allegro.h>
#include <allegro5/allegro_scope.h>
```

```
int main(int argc, const char *argv[]) {
    if (!al_init()) return 1;
    ALLEGRO_EVENT_QUEUE *queue = al_create_event_queue();
    ALLEGRO_DISPLAY *display = al_create_display(640, 480);
    ALLEGRO_BITMAP *bitmap = al_create_bitmap(32, 32);

    al_register_event_source(queue, al_get_display_event_source(display));

    al_destroy(queue);
    al_destroy(bitmap);
    al_destroy(display);

    return 0;
}
```

- Scope template class, which uses al_destory template function on scope completion:

Toggle example

```
#include <allegro5/allegro.h>
#include <allegro5/allegro_scope.h>
```

```
int main(int argc, const char *argv[]) {
    if (!al_init()) return 1;
    Scope<ALLEGRO_EVENT_QUEUE> queue = al_create_event_queue();
    Scope<ALLEGRO_DISPLAY> display = al_create_display(640, 480);
    Scope<ALLEGRO_BITMAP> bitmap(al_create_bitmap(32, 32));

    al_register_event_source(~queue, al_get_display_event_source(~display));

    return 0;
}
```

- ScopeList class, which has container to store ALLEGRO_* types (actually, as void *) and invoke appropriate al_destroy_* function (in some predefined order, e.g. al_destroy_display function used last) on scope completion:

Toggle example

```
#include <allegro5/allegro.h>
#include <allegro5/allegro_scope.h>
```

```
int main(int argc, const char *argv[]) {
    if (!al_init()) return 1;
    ScopeList sl;
    ALLEGRO_EVENT_QUEUE *queue = al_create_event_queue(); sl.Add(queue);
    ALLEGRO_DISPLAY *display = sl << al_create_display(640, 480);
    ALLEGRO_BITMAP *bitmap = sl << al_create_bitmap(32, 32);

    al_register_event_source(queue, al_get_display_event_source(display));

    return 0;
}
```

Some notes:

The allegro5/allegro_scope.h header file is context sensitive, which means, that you need to include it after other allegro* header files (including addons). This is because of preprocessor, which checks used header files (by already defined header guards, e.g. `__al_included_allegro5_allegro_h`) to associate their ALLEGRO_* types and al_destroy_* functions (where associations created manually).

How to install:

The allegro5/scope is header-only addon, at the moment, with some defined directory structure for Allegro5 addons. I created allegro5/scope/scope.cpp file as a stub for compatibility with TheIDE, but not required to compile. Therefore, either:

- include the path to base folder with allegro5/scope addon

or

- in terms of TheIDE, create new assembly with following package nests:

AllegroDev;Allegro;Libraries;upp\uppsrc

where AllegroDev is path to base folder with allegro/scope addon; other paths explained above.

And add allegro5/scope package to your application package.

In the attachments archive you could find allegro5/scope addon and some example.
