That would be great if it was incorporated in upp.

M\$VC has good serial code, it may be tied in with their managed CL or whatever. Python has a good PySerial.

The code I am tinkering with works on WinXP but not Win7 32bit or 64bit. I am just getting a last error dwWord 6 which I have no idea what that is. A M\$VC app just to check the ports works as well as the Sirfdemo, Python,

I am having the same problem with Jerson's code.
