Hello,

This report generator is great and working well

As I told you, I'll have to print identification labels on Avery (TM) sheets. These labels must have a barcode. I made some first tries, combining RepGen and this small package that somebody wrote

It's working fine, and I found a way to skip the first labels, in case of re-use of begun sheets. I'll try to find some time to write a test program for labels printing with barcodes.

But I have some difficulties to align well the printing with the labels. Probably, there is no other way than the trials / errors method, playing with cells and rows margins. But how can I reduce the page margin ? The left margin before the 1st cell is too large, and I don't know how to make it smaller in UWord. How can I do that ?
