To explain better, let's suppose that in an application, you have 2 reports, each one with a different page size.

For now, as you cannot specify the page size in the QTF template document, you must have a different code for each report to adjust the page size.

If it was possible to have the page size included in each template document, you could have the same code to print both.

If it can preset the print dialog box, it could be surely useful for some people, however I don't really need that for now : no need in my case to change page size at print time.

I think that if QTF can do the same as RTF about page size, it will be great ! And enough for me ! But if sergeynikitin reads this, it will be interesting to have his opinion.
