I would like to vote for an automatic testing program as a critical next-step activity.

drjo1952

Buildbot is good for both automated building and testing.

uppsrc/BuildAll builds all of reference and examples..

Original intention was to run it before each release

I agree that some automated testing system would be nice. In fact, I guess this is where dolik's experimental website might be useful

Well, this one-loop app is far-far away in capabilities from buildbot, which is quite powerfull and easy to set up.

IMHO it would be better to spend time improving U++ itself instead of reimplementing already well working apps.
